

# Pension Finance Watch

## Fourth Quarter 2020

### Results for Canadian Defined Benefit Pension Plans

The Willis Towers Watson Pension Index has increased in the fourth quarter due to positive investment returns. The net effect on our benchmark plan was an increase of 3.6% in the Willis Towers Watson Pension Index (from 74.9 to 77.6) for the quarter.

The asset mix underlying the Willis Towers Watson Pension Index was changed to be more representative of the typical asset mixes of pension plans in Canada. A comparison of the two mixes was included in the Pension Finance Watch for Q1 2020.

### About This Report

This report reviews how capital and equity market performance affected Canadian defined benefit pension plans, with a focus on linked asset/liability results. Specific plan results depend on liability characteristics, portfolio composition and actual investment results, among other factors.

This information has been prepared for clients of Willis Towers Watson. For information on how this issue affects your organization, please contact your consultant, or one of the following consultants:

## Canadian Interest Rates

The Bank of Canada maintained its overnight lending rate at 0.25% throughout Q4 and in December released forward guidance that it will continue to target this rate. The 91-day T-bill rate saw a decrease during the quarter, falling by 3 bps. Conversely, the yield on 30-year and 10-year Canada Treasuries increased by 10 bps during the quarter. However, optimism surrounding the vaccine rollout and an economic recovery saw a further decrease in credit spreads and an accompanying decrease in corporate bond yields. As a result, the benchmark discount rate determined under the RATE:Link methodology used to determine defined benefit obligations decreased by 5 bps, leading to an increase in accounting liability measures over the quarter.

### Canadian Bond Yields (End of Period)

	Dec. 2020	Sep. 2020	Dec. 2019
<b>Canada Treasuries<sup>(1)</sup></b>			
30-year	1.21	1.11	1.76
10-year	0.67	0.57	1.70
91-day T-bill	0.09	0.12	1.66
<b>Corporate Bonds<sup>(1)</sup></b>			
FTSE	1.71	1.90	2.80
<b>Benchmark Discount Rate</b>	2.62	2.67	3.05

## Investment Returns

It's hard to believe that 2020 has come to an end and while the pandemic shook the world economies and sent global financial markets into a freefall in Q1 the equity markets were able to rebound and post positive returns for the year. The equity markets in Q4 started off strong rebounding from a poor September performance, however, quickly took a turn as volatility due to uncertainty in the US election gripped investors. Following the Biden victory and unveiling of positive efficacy results from three COVID-19 vaccine candidates, the markets ended the quarter on a strong note and posted positive returns. US and other developed international equity markets lead the charge with low double digits returns in local currency terms for the quarter, while Canadian equities posted high single digit returns. During Q4 we saw a strengthening in the CAD which, for unhedged Canadian investors, decreased CAD returns on US and international equity investments.

Corporate bonds saw positive returns over the quarter due to narrowing of credit spreads. While government of Canada bonds saw slightly negative returns due to an increase in yields.

**Asset Class Returns**

	Q4 2020	YTD	Last 12 months
<b>Stock Returns</b>			
Canadian Equities – S&P/TSX Composite <sup>(2)</sup>	9.0%	5.6%	5.6%
U.S. Equities – S&P 500 (Canadian dollars) <sup>(3)</sup>	7.6%	16.5%	16.5%
Non-North American Equities – MSCI EAFE (Canadian dollars) <sup>(4)</sup>	11.3%	6.1%	6.1%
<b>Canadian Fixed Income Returns</b>			
91-day T-Bills	0.0%	0.9%	0.9%
FTSE Universe Bonds	0.6%	8.7%	8.7%
FTSE Long Bonds	0.8%	11.9%	11.9%

The benchmark plan's 50% equity / 50% fixed income portfolio increased 5.1% for the quarter. The more conservative 30% equity portfolio increased 3.4% for the quarter, and the more aggressive 70% equity portfolio increased 6.8% for the quarter.

Pension plan liabilities under Canadian, International and U.S. accounting standards are measured using a discount rate based on yields available on high-quality corporate bonds as of the measurement date. Using the same RATE:Link methodology as we use for the Willis Towers Watson Pension Index in other countries, the discount rate for our benchmark plan decreased over the quarter by 5 basis points to 2.62% at December 31, 2020. Among other factors, the selected discount rate depends on projected plan cash flows, the bond data and the methodology utilized for constructing the yield curve. The RATE:Link approach represents one possible methodology; other acceptable methodologies may result in higher or lower discount rates, and consequently lower or higher plan liabilities.

Willis Towers Watson tracks the monthly change in its Pension Index in a series that dates to December 31, 2000. Like bond prices, pension liability values move in the opposite direction to interest rates. The Willis Towers Watson Pension Liability Index increased by 1.4% for the quarter, reflecting the combined effect of interest accumulation and the discount rate change.

The impact of the decrease in the liability discount rate together with the positive investment returns resulted in a net increase in the Willis Towers Watson Pension Index over the quarter, from 74.9 to 77.6 as at December 31, 2020. The change in the Willis Towers Watson Pension Index does not reflect any contributions made to reduce the size of any deficit or any contribution holiday taken on account of any surplus.

Canadian Pension Index Results			
	Q4 2020	YTD	Last 12 Months
<b>Portfolio Returns</b>			
30% Stocks/70% Fixed Income	3.4%	11.7%	11.7%

<b>Benchmark Plan Liability Results</b>			
Change in Pension Liability Index	1.4%	10.2%	10.2%
<b>Percentage Change in Pension Index</b>	3.6%	1.1%	1.1%

### A Note to Our Readers

This publication tracks the asset/liability performance of a hypothetical Canadian benchmark pension plan, based on a 50/50 asset mix and a typical liability profile. The index is not intended to represent an average funded ratio. Rather, the intent is to provide plan sponsors with a consistent and relevant measure to serve as a general indicator of the effects of capital market events on pension plan financing.

### Definition of Terms

#### Bond Yields

- The 30-year Canada semi-annual bond yield reflects the yield on the actively-traded Government of Canada bond maturing in 30 years.
- The 10-year Canada semi-annual bond yield reflects the yield on the actively-traded Government of Canada bond maturing in 10 years.
- The 91-day T-Bill semi-annual yield refers to the yield on Government of Canada treasury bills which mature in 91 days.
- The FTSE Corporate semi-annual bond yield reflects the yield on the FTSE Corporate Bond Index composed of corporate bonds with varying maturity.

#### Asset Class Returns

- Total return incorporates the combined effect of price changes and interest or dividend income. This will typically differ from the daily results published in financial journals, which are based only on price changes.
- S&P/TSX Composite refers to the “S&P/TSX Composite Index”, which tracks larger companies in the Canadian market.
- S&P 500 refers to the “S&P 500 Index”, which tracks the largest 500 companies in the U.S. based on the market value of their equity. Total return is reported in terms of the Canadian dollar and therefore includes the effect of currency changes.
- MSCI EAFE refers to the “Morgan Stanley Capital International Europe, Australasia, Far East Index” of equity securities. Total return is reported in terms of the Canadian dollar and therefore includes the effect of currency changes.
- 91-Day T-bill returns are based on the “FTSE 91-day Treasury Bill Index”.
- FTSE Universe Bonds refers to the “FTSE Universe Bond Total Return Index” for government and corporate bonds of all maturities in excess of one year.
- FTSE Long Bonds refers to the “FTSE Long Term Bond Total Return Index” for government and corporate bonds with maturities in excess of 10 years.

## Portfolio Returns

- The Willis Towers Watson Pension Index 50% / 50% portfolio return is based on a diversified portfolio of 50% equity (10% Canadian, 20% U.S. and 20% MSCI EAFE) and 50% fixed income (FTSE Long Bonds).
- The 30% and 70% equity portfolios are constructed with similar composition within their equity and fixed income components.

## Benchmark Discount Rate

- The discount rate is determined each month for this benchmark pension plan based on observed yields for high-quality corporate bonds and the benchmark plan's projected cash flows. Higher or lower discount rates may be more appropriate for other plans with different expected cash flows.\* Furthermore, a variety of methodologies may be used to interpret the data available on long-term Canadian corporate bonds. This calculation uses the same RATE:Link methodology as we use for the Willis Towers Watson Pension Index in other countries. Other acceptable methodologies may result in higher or lower discount rates, depending on market conditions.

## Willis Towers Watson Pension Liability Index

- The Pension Liability Index tracks the change in the benchmark plan's obligations due to the accumulation of interest and changes in financial assumptions. For this purpose, the obligations are measured based on the requirements of U.S. and International accounting standards.\*
- Contributions are set equal to the level of benefit payments for the benchmark plan.

## Willis Towers Watson Pension Index

- The Willis Towers Watson Pension Index is the ratio of market value of assets to accounting obligations for the benchmark plan. Assets change from month to month based on the investment performance of the 50% / 50% portfolio, assumed contributions and benefit payments. Liabilities change from month to month due to accumulated service cost and interest, benefit payments and the effects of any other changes in the Willis Towers Watson Pension Liability Index. The Willis Towers Watson Pension Index is an accounting measure, not a funding measure. As such, it is not appropriate to consider this as a measure of a pension plan's funding, which is based on statutory requirements.

---

\* The discount rate assumption is adjusted to reflect changes in market interest rates. Our benchmark plan is a traditional final-pay pension plan with approximately half of the liabilities in respect of active employees and half of the liabilities in respect of terminated vested and retired employees. Plans with different designs or demographic characteristics will see different results in terms of both the level of appropriate discount rate and the plan's response to changes in financial assumptions.
